

Table 1. List of tests and their properties discussed in this paper, where “section” refers to the subsection of this paper, “single- / multi” denotes if it is a single- or multi-station technique and “depends on time” reads if the result of the test depends on when the test is performed. Here we point to the basic characteristics of the tests. In fact, all the tests using metadata depends on time as metadata could be potentially updated anytime. “Output” lists what quantity we use to communicate the results and “hours to perform” shows, how long does it take to run the test. Note, that StationXML formal checks concern many properties, which are listed separately in Table 2.

test	section	tested properties	station single- type / multi	source of information	tested period	depends on time	output	hours to perform	
retrievability	3.1	FDSN-availability	any	single	taken from EIDA	any / month	yes	percentage	4
		WFCatalog availability			percentage				
		retrievability			data			percentage	
		metadata deconvolution			metadata			yes / no	
noise levels	3.2	amplitude @3.0 Hz	any	multi	data + metadata	day	no	histograms	8
		amplitude @5.0 s						histograms	
		amplitude @20.0 s						histograms	
StationXML	3.3	see Table 2 for details	any	single	metadata	all / AdA epochs	no	0 – 5 grades	8
earthquake data	3.4	technical checks	BB	single	data	40 - 90 mins of EQ record	no	keywords	4
		metadata deconvolution			data + metadata			yes / no	
wavefront tracking	3.5	transfer function in PaZ	BB	multi	data + metadata	40 - 90 mins of EQ record	no	yes / no	4
		time shifts						yes / no	
		polarity (if phase times used)						yes / no
