## Introduction

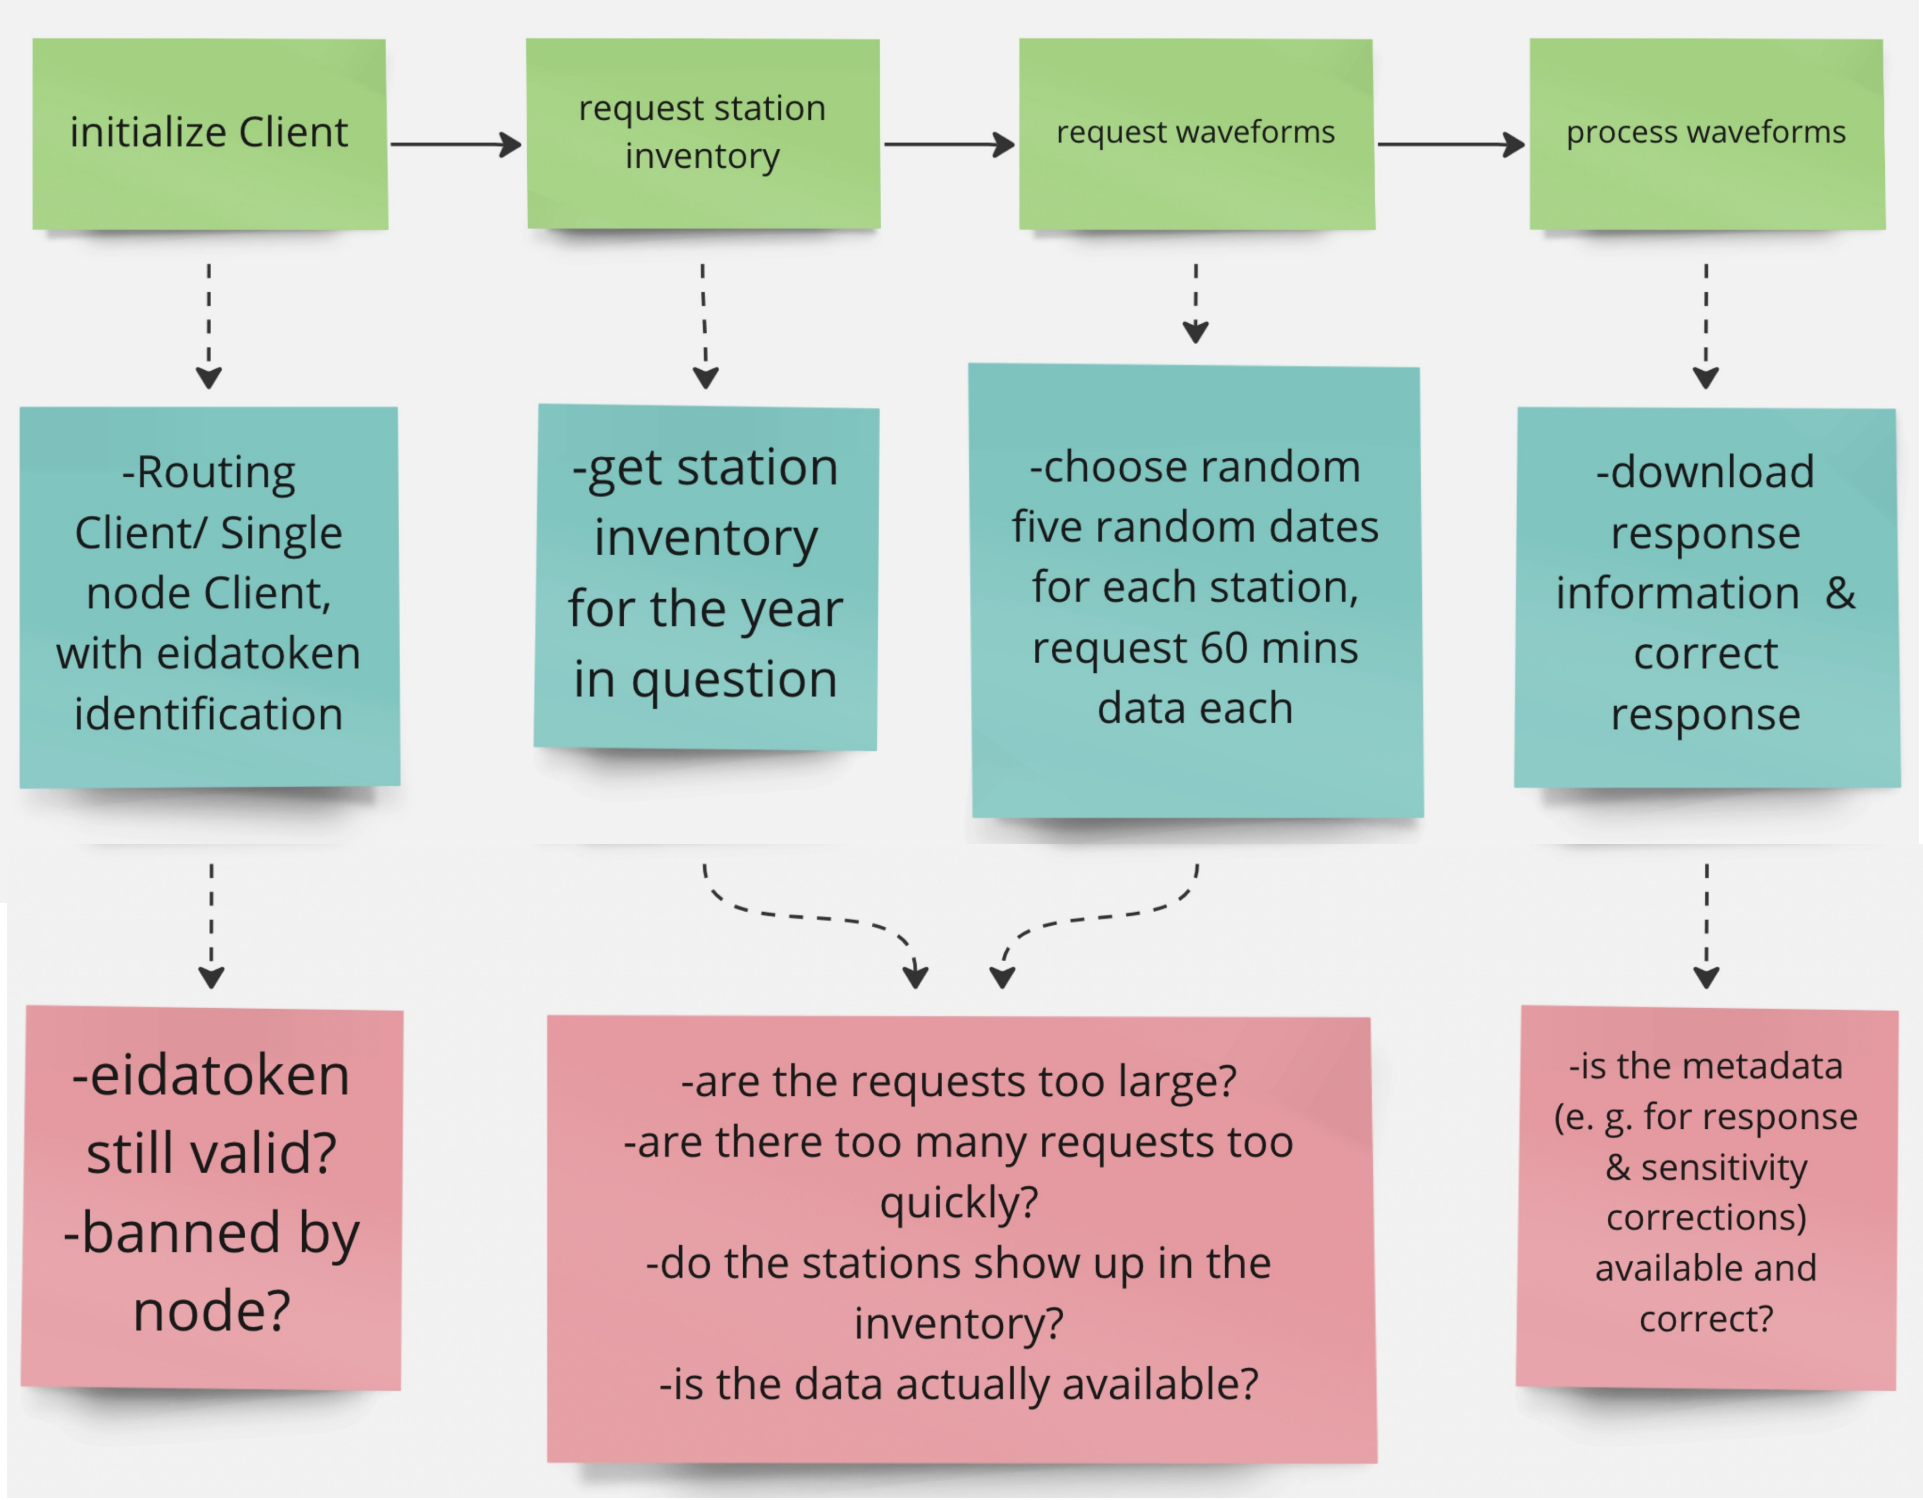

We conducted an ongoing series of tests concerning the availability of data within the AdriaArray project.

The availability is tested from the end user perspective. Since the download and subsequent response correction can fail for a multitude of reasons, we try to implement many different features to make these tests as insightful as possible.

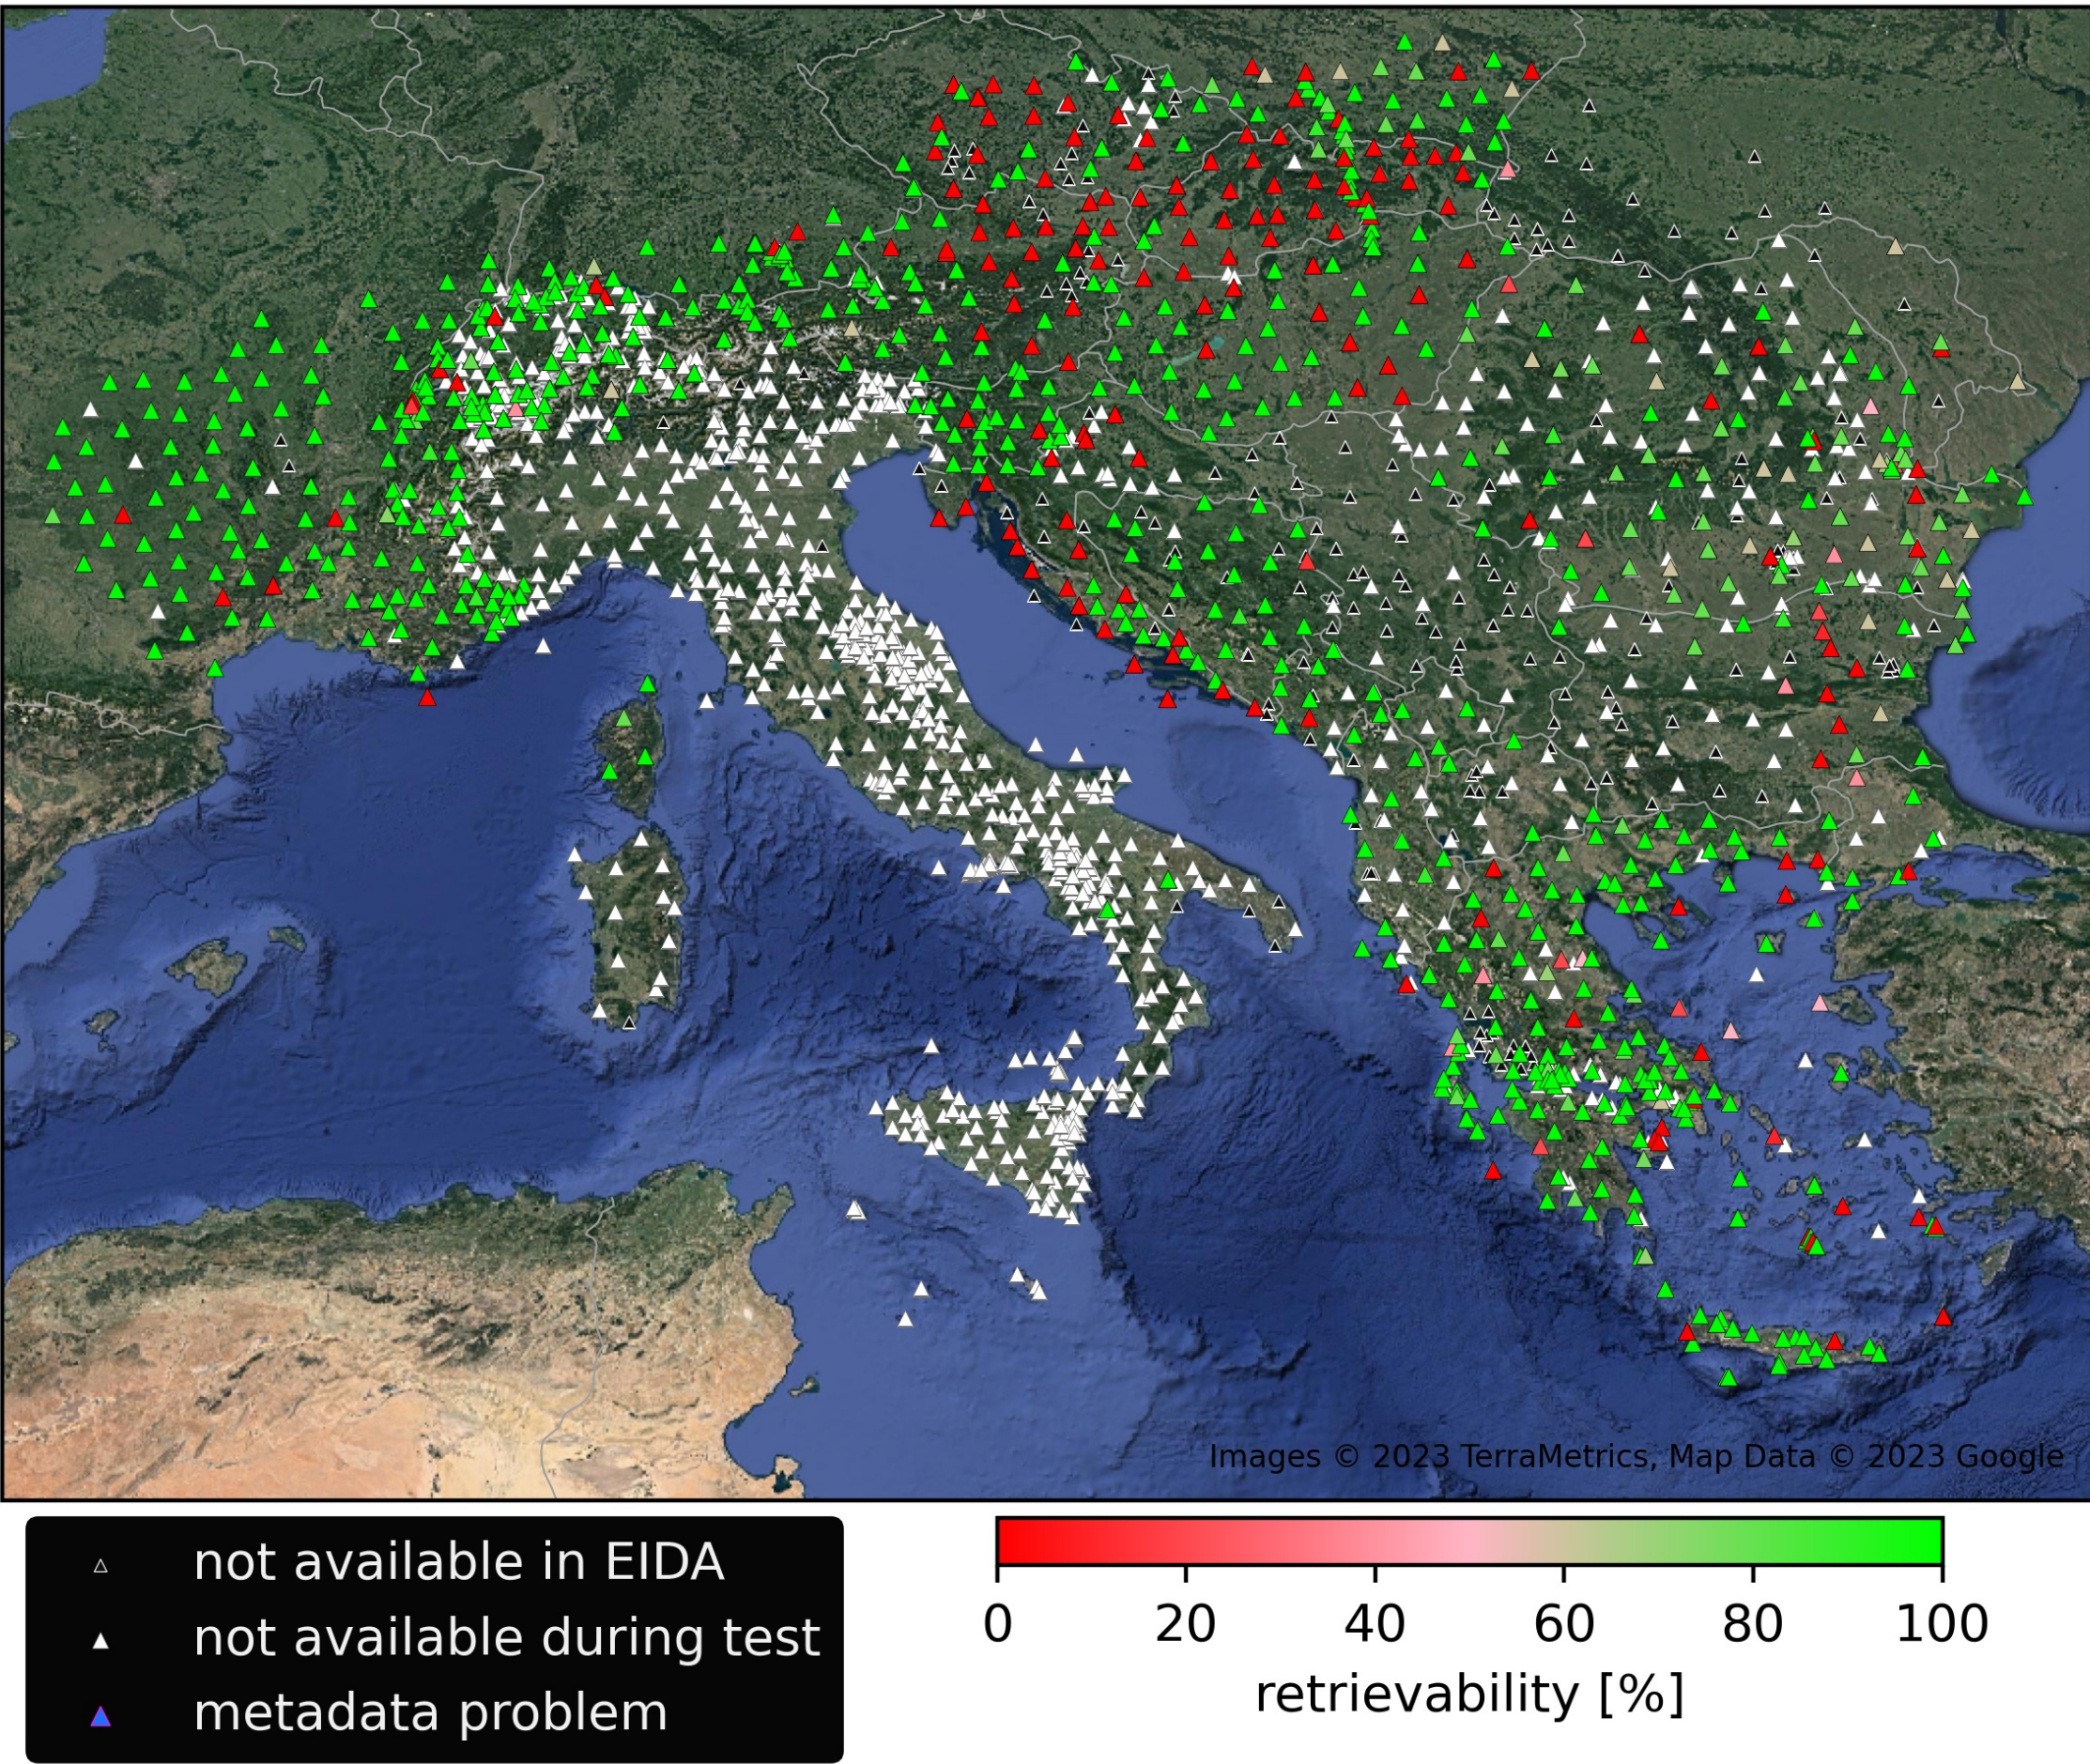

The tests are run concurrently from multiple locations, to minimize the impact of local network outages on the results, as well as provide a way to find out if there are specific problems with individual download locations.

Information about availability is also recovered from the WFC and FDSNWS web services and recorded alongside the test results.

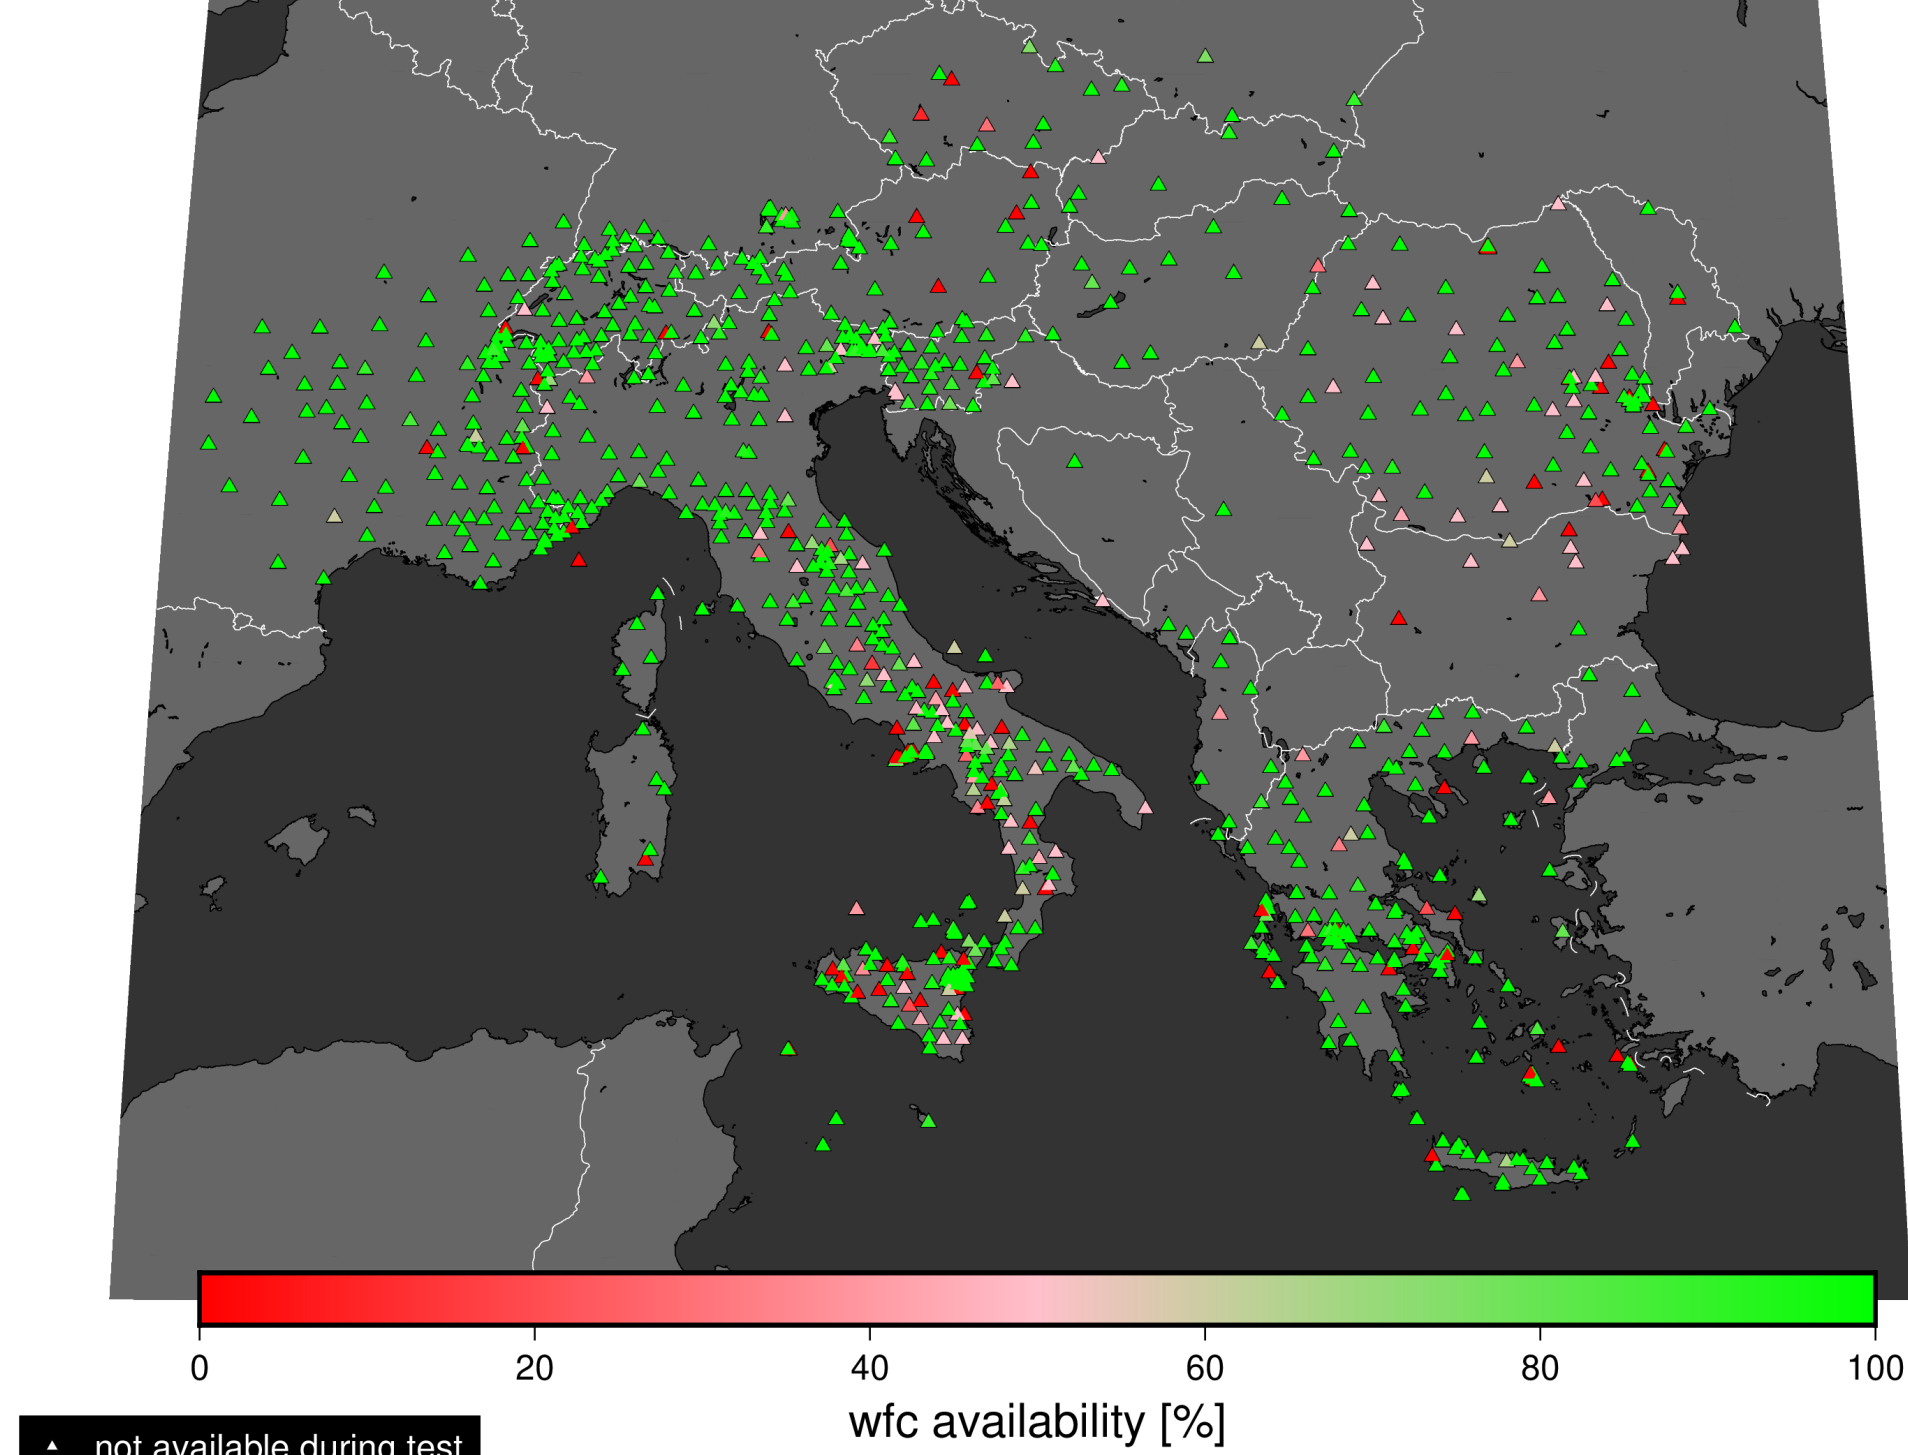

## Testing Procedure

Availability for October 2023, checked in November 2023

Availability for August 2022, checked in October 2022

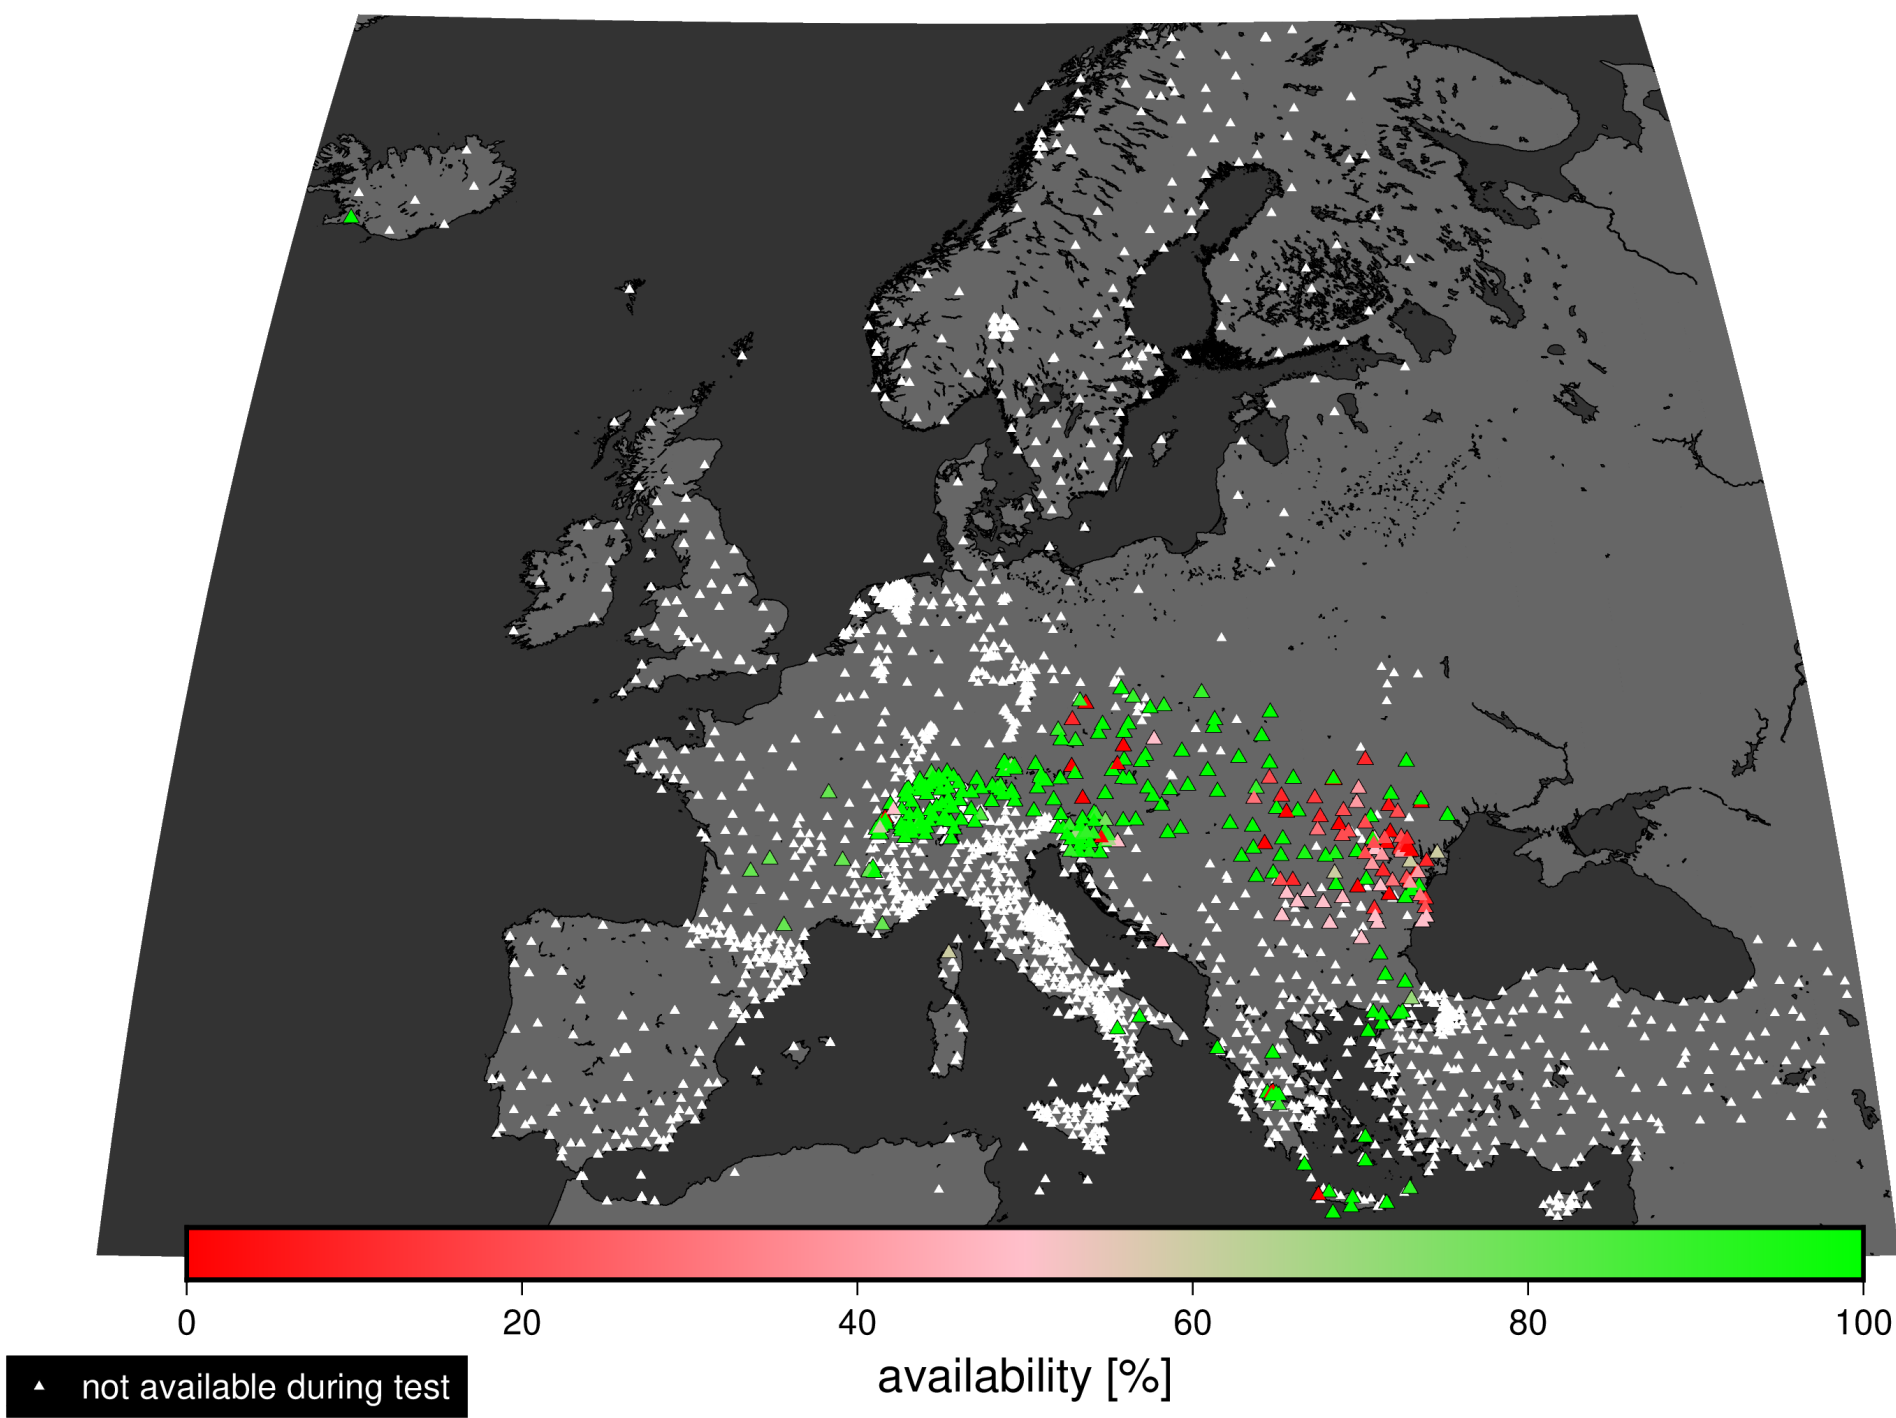

## Testing Scripts Available At:

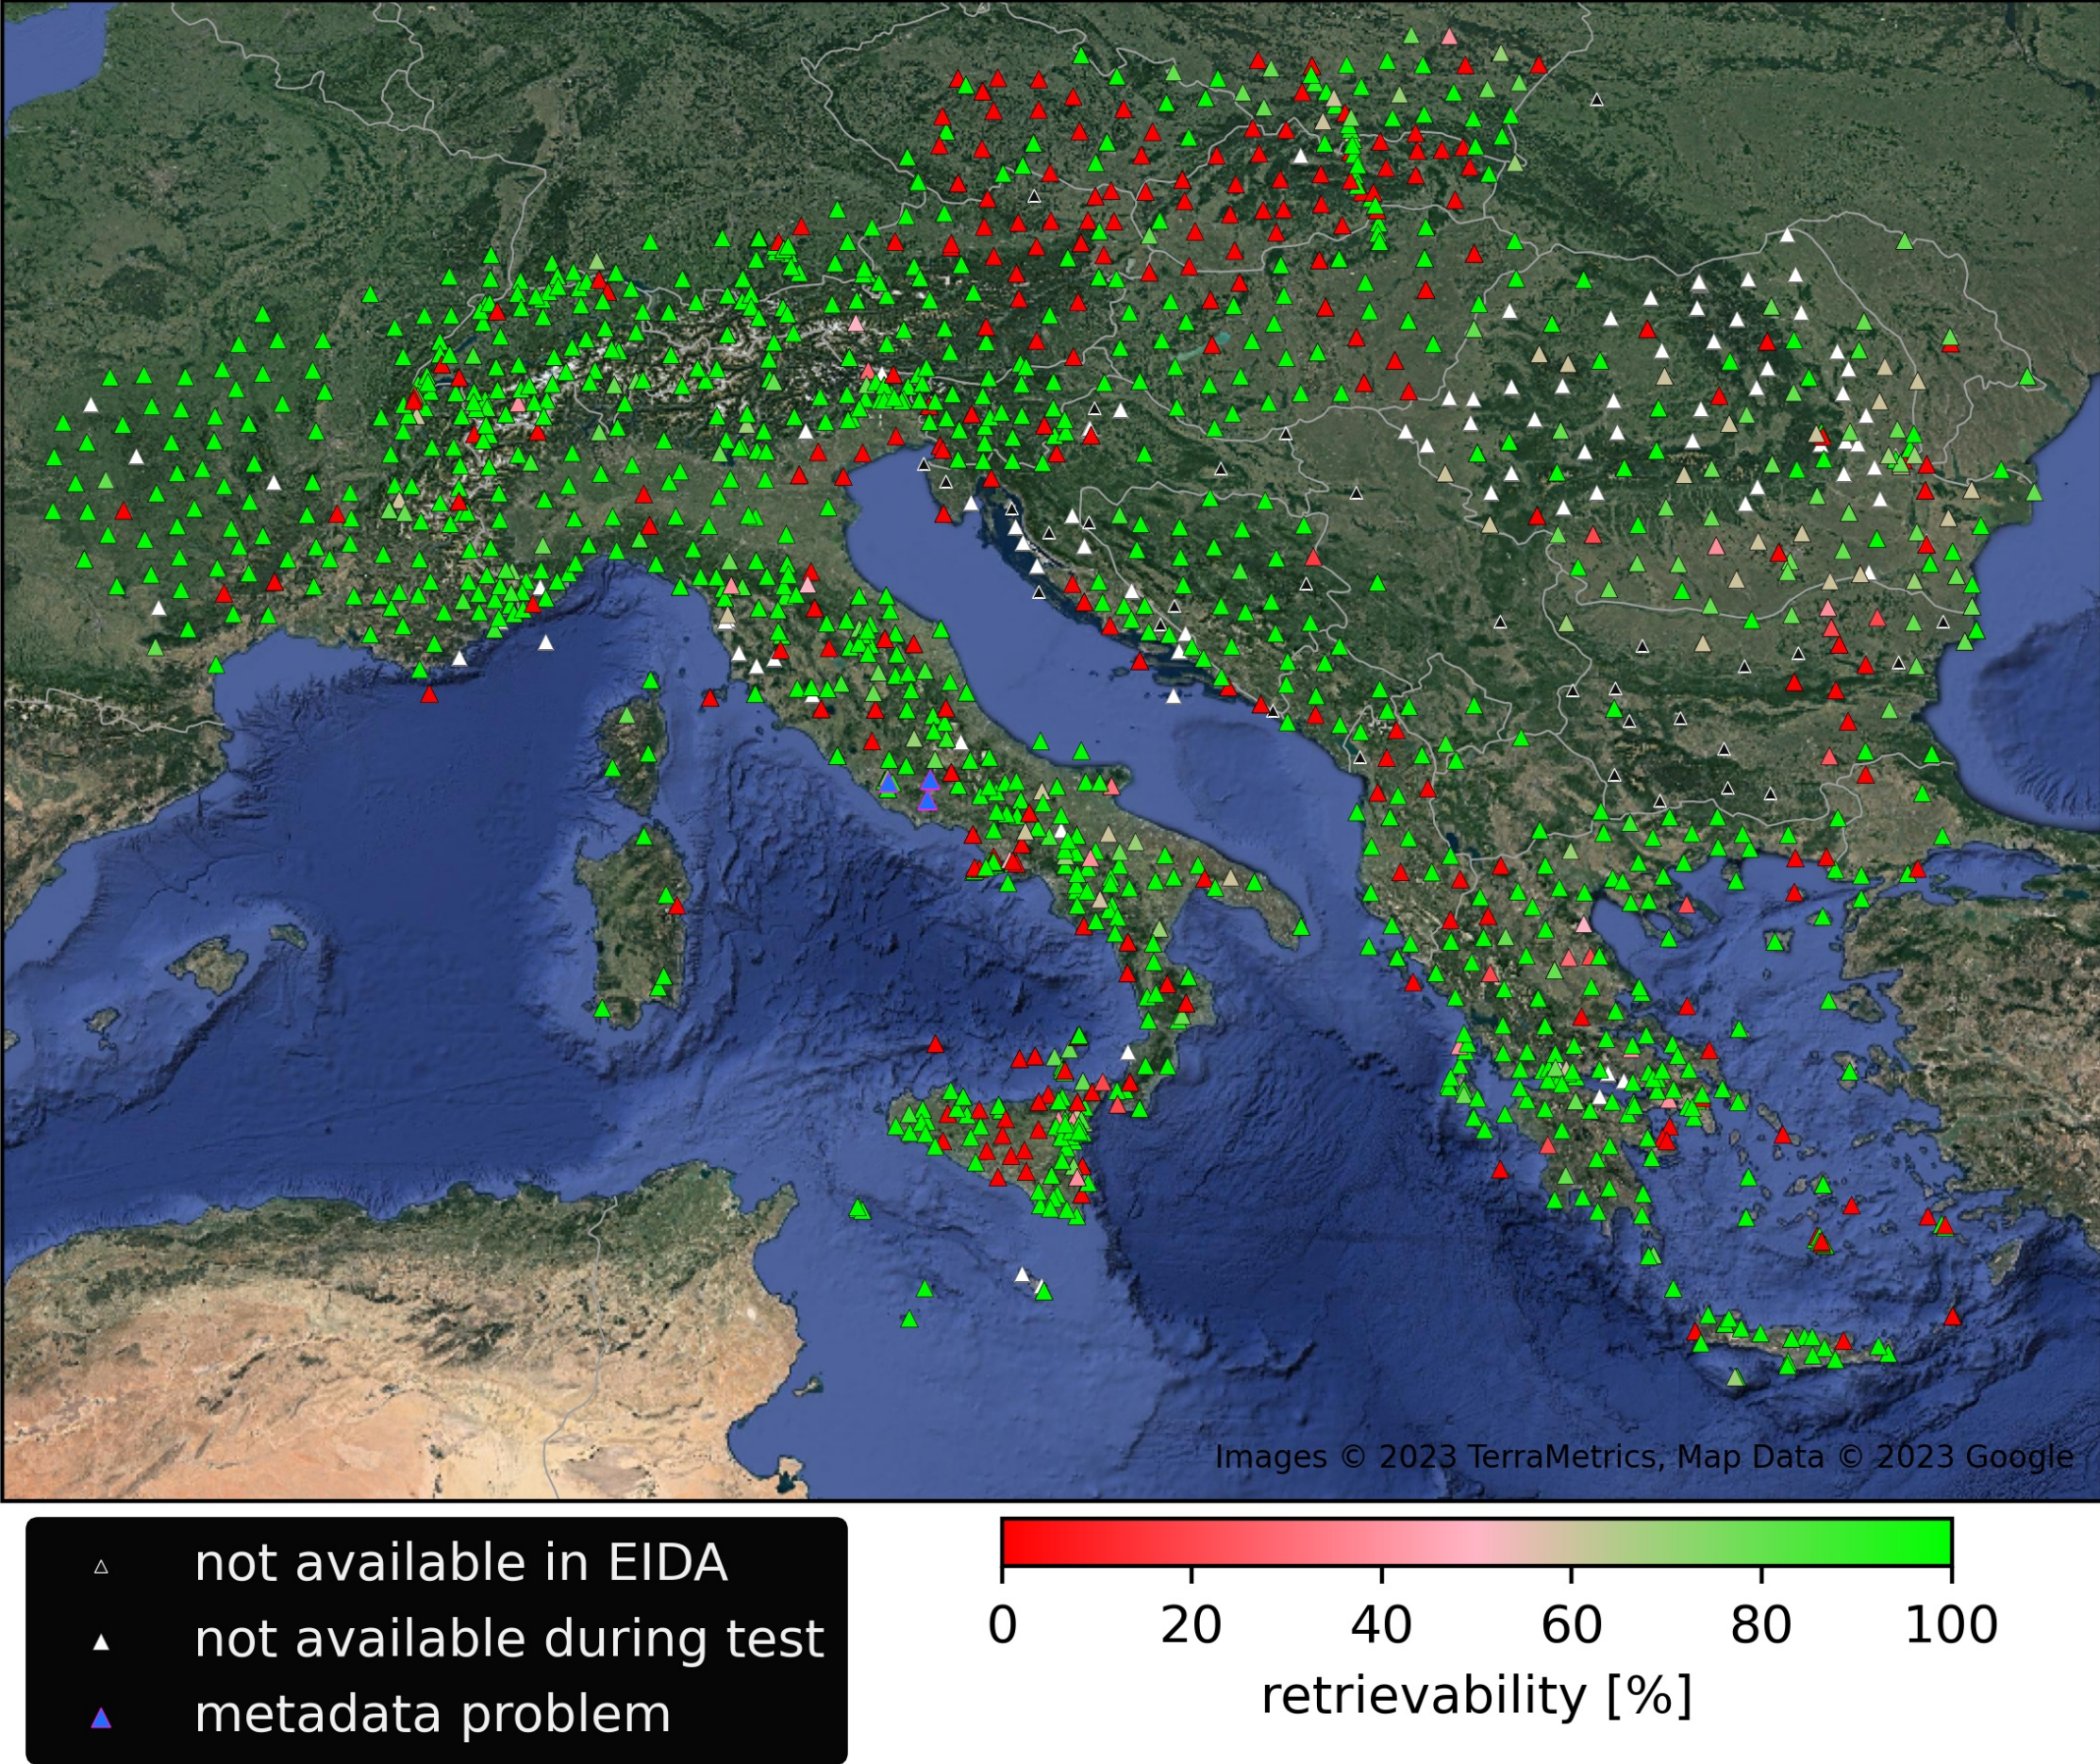

<https://github.com/doukutsu/eida-data-monitoring>

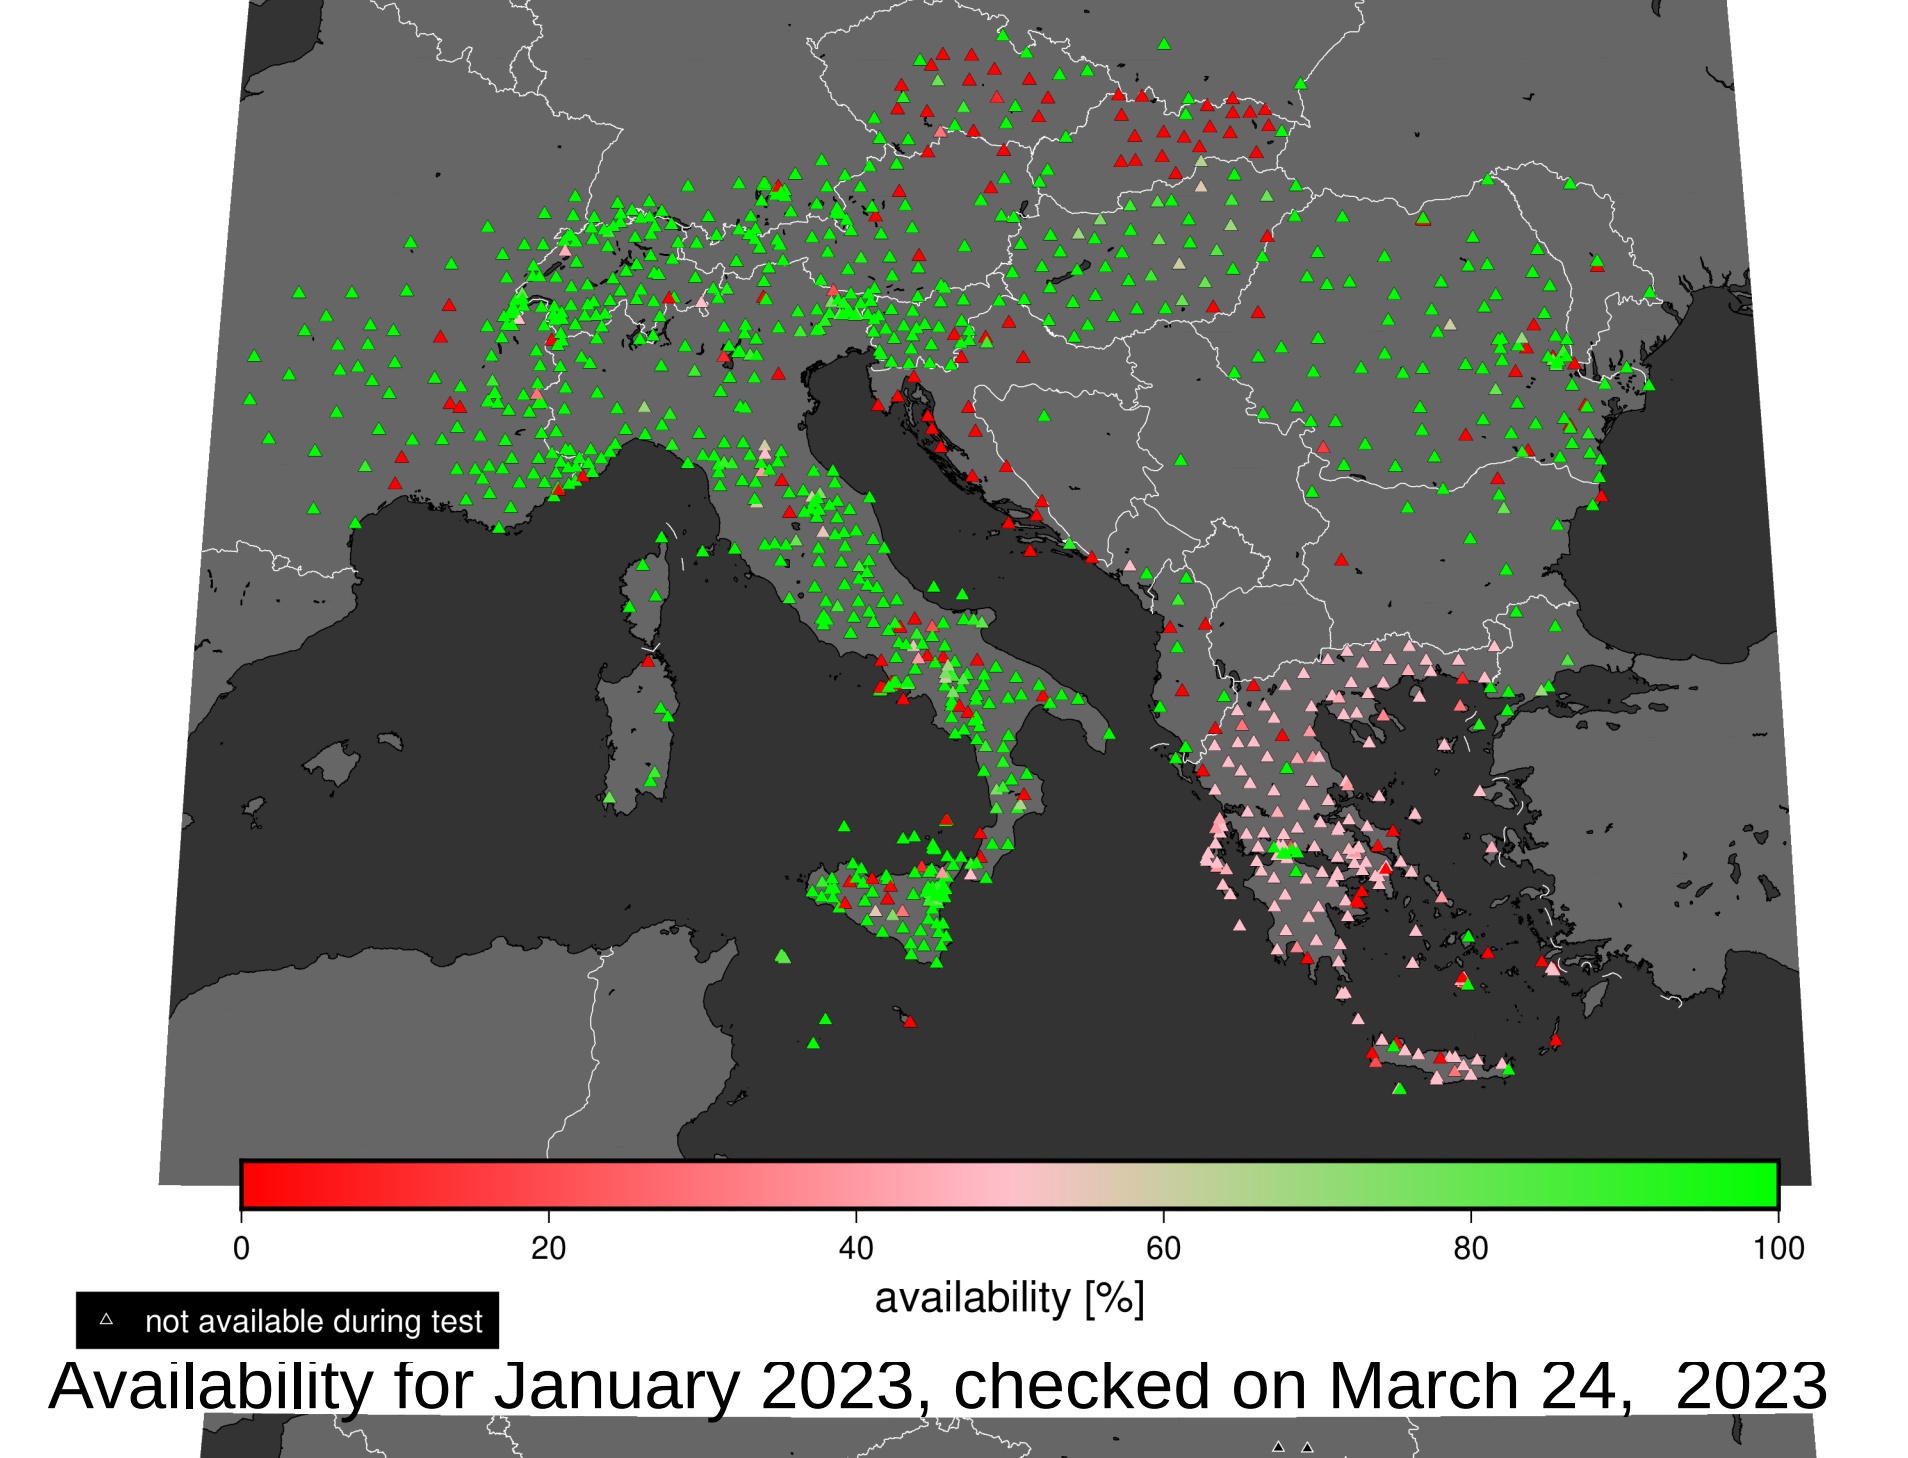

Availability for March 2022, checked in June 2022

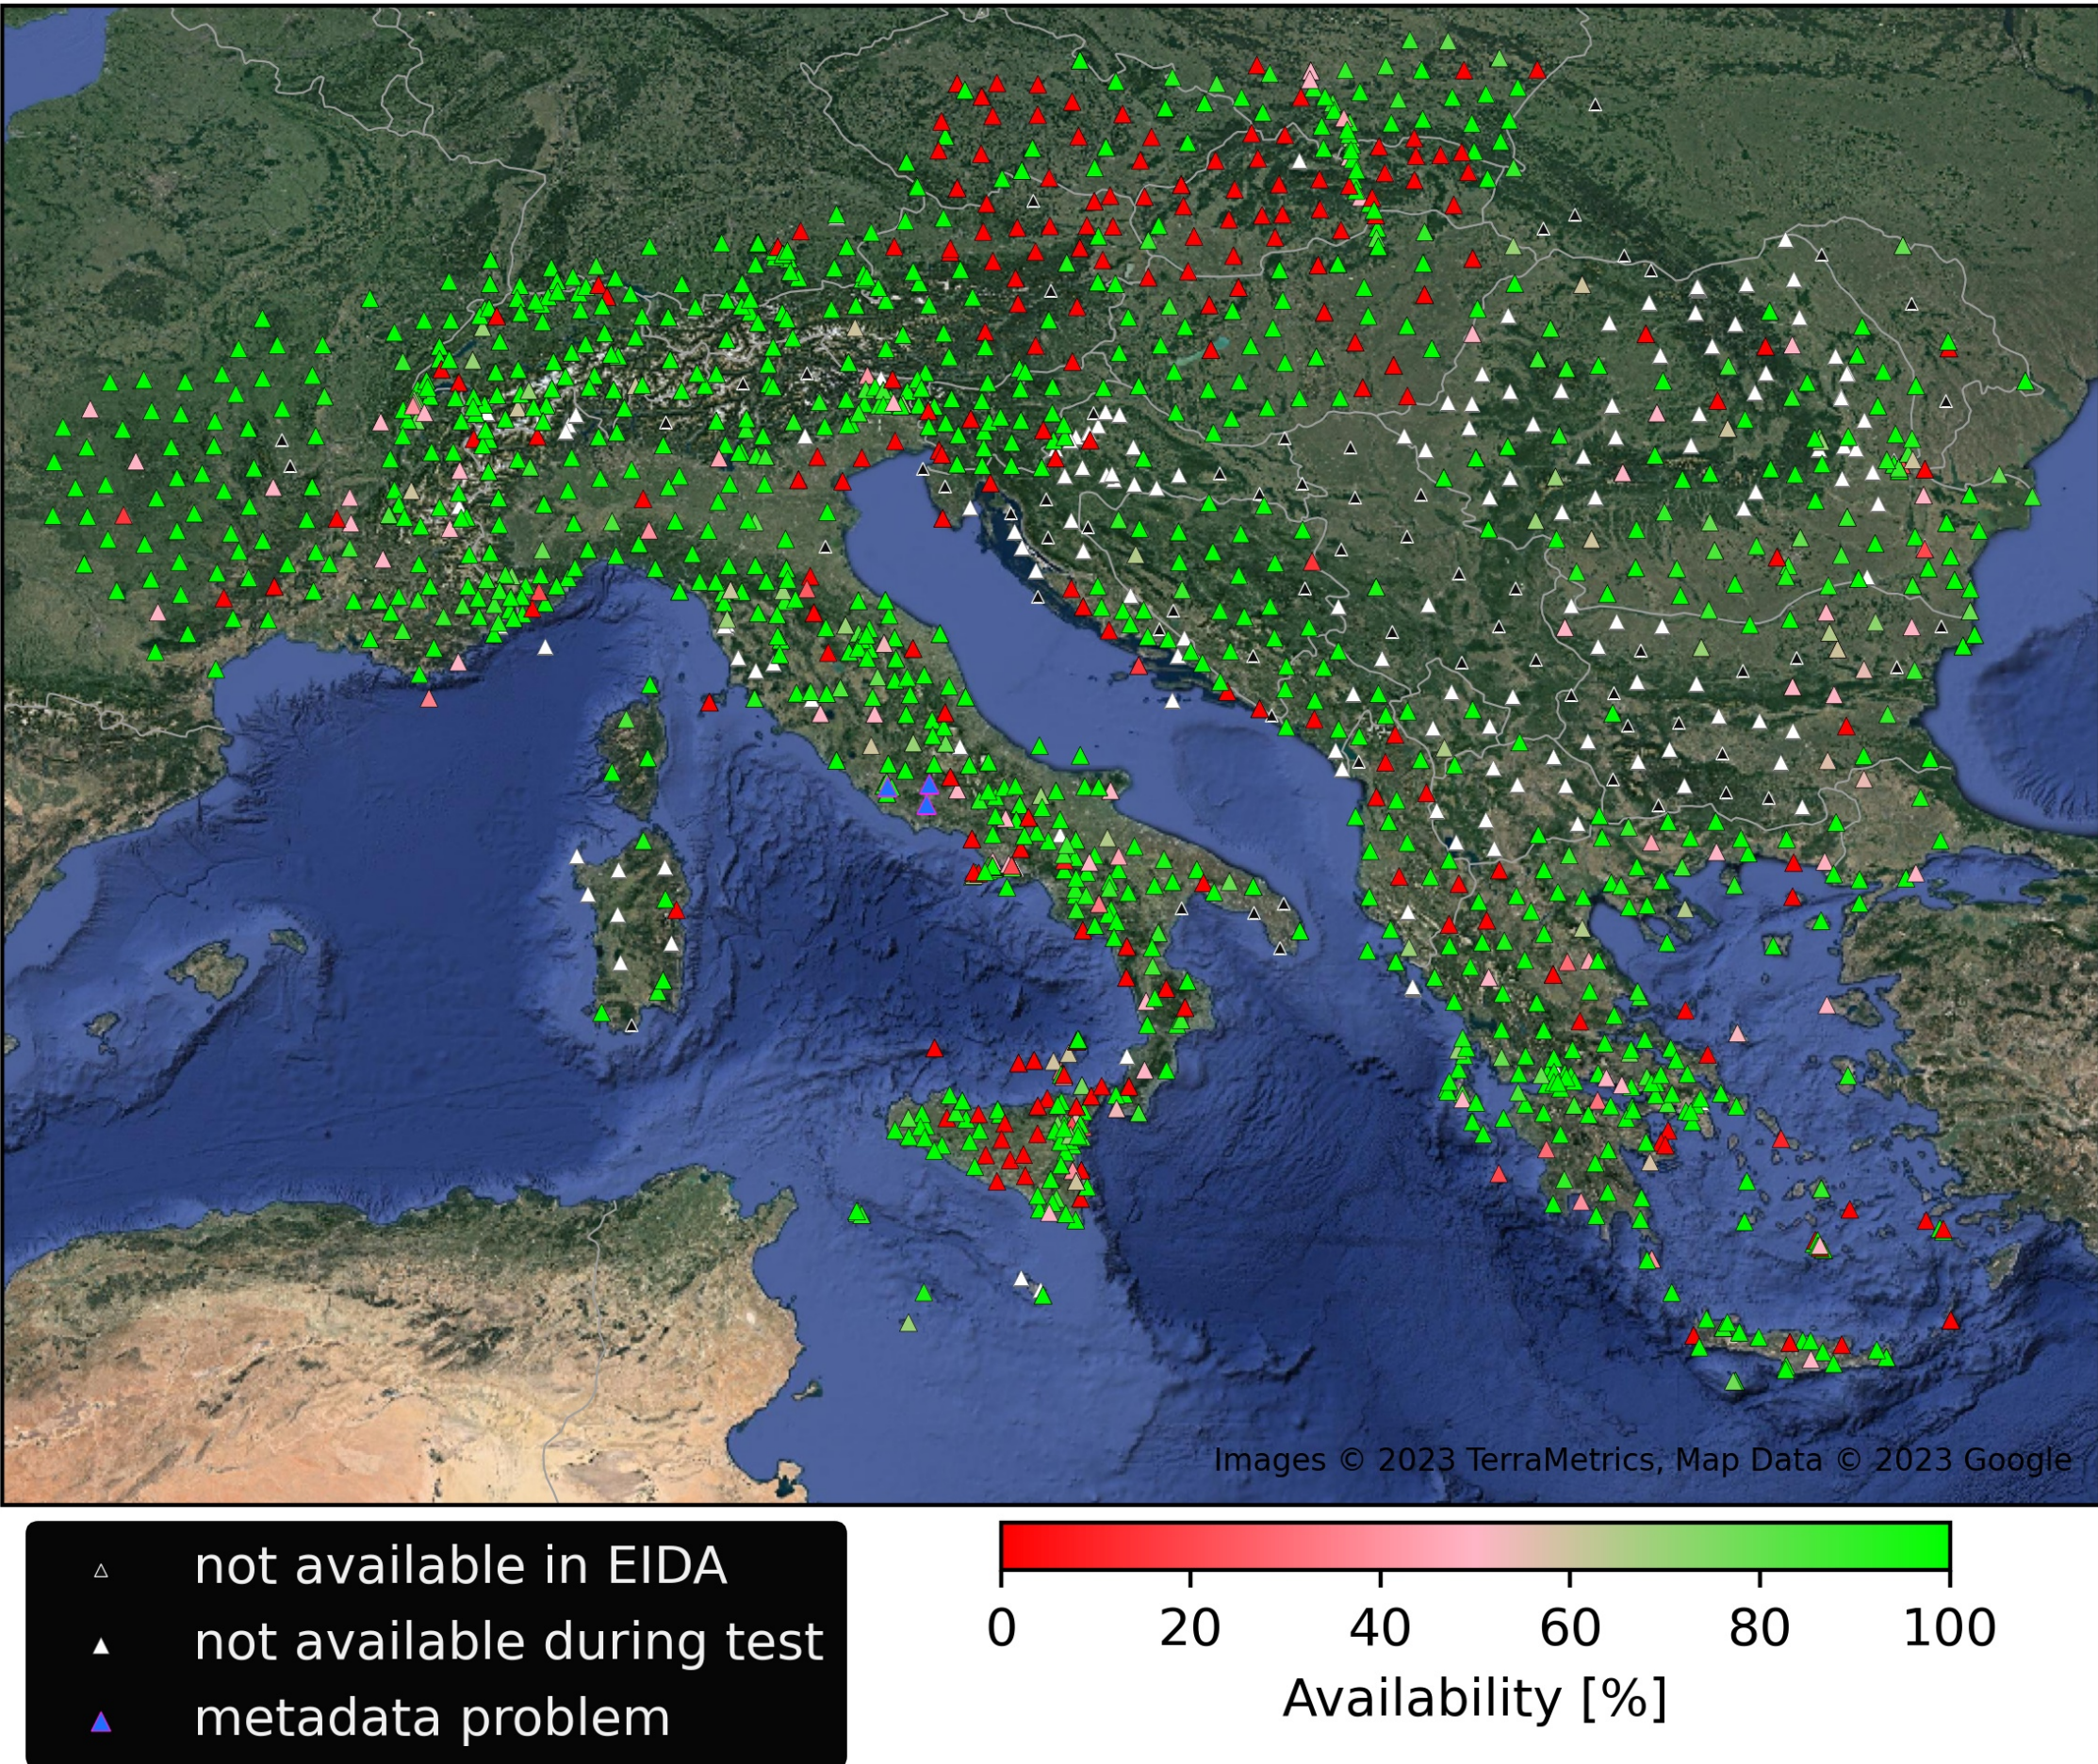

Availability for October 2023, checked in November 2023

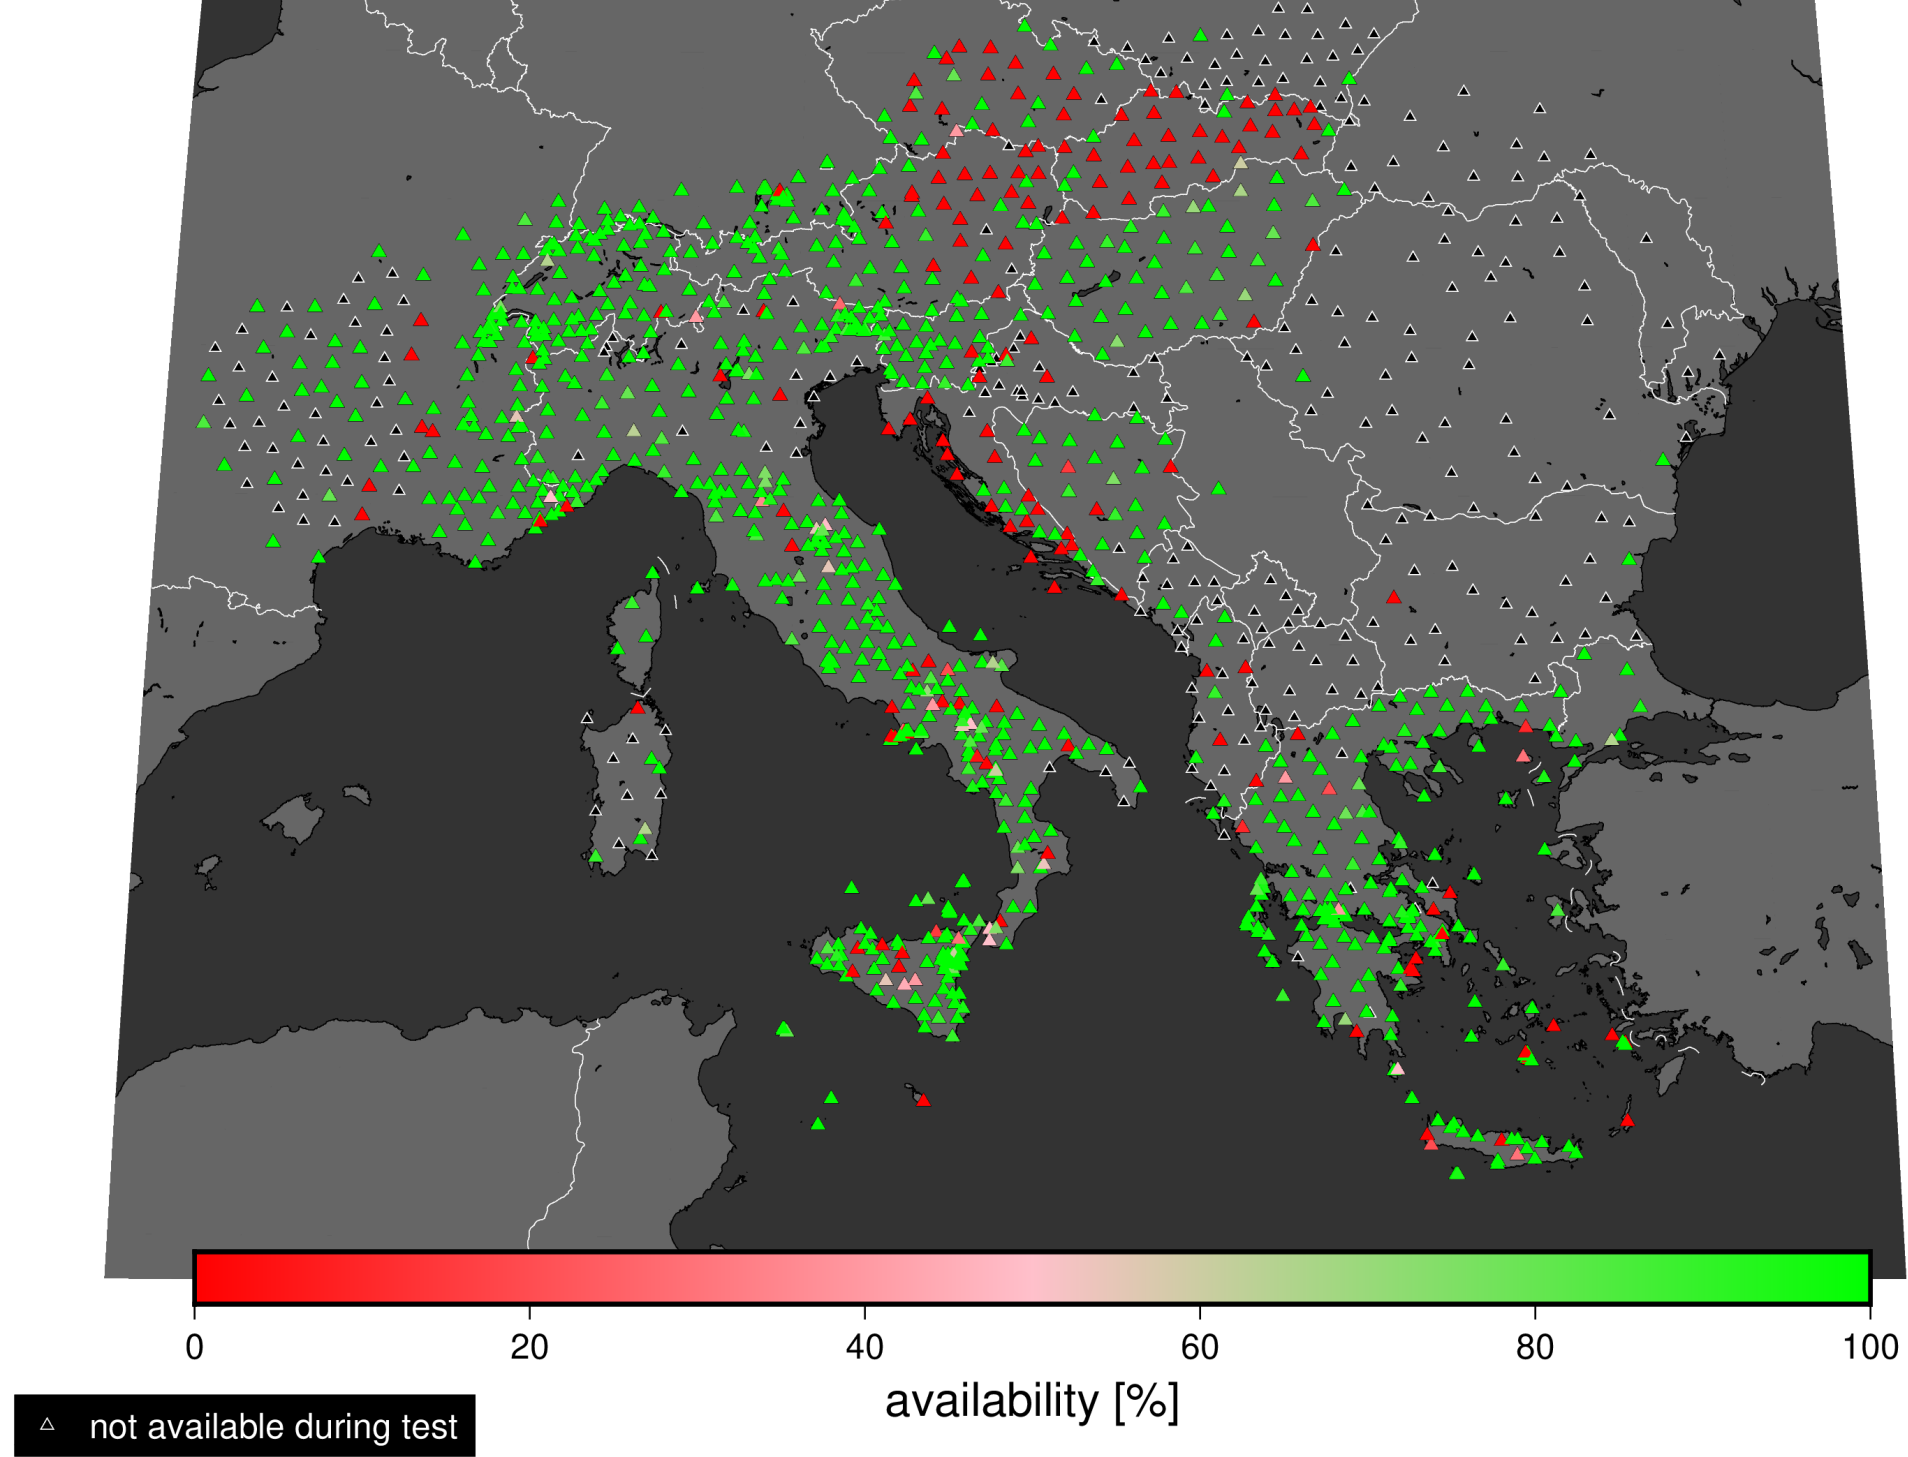

Availability for January 2023, checked on February 23, 2023

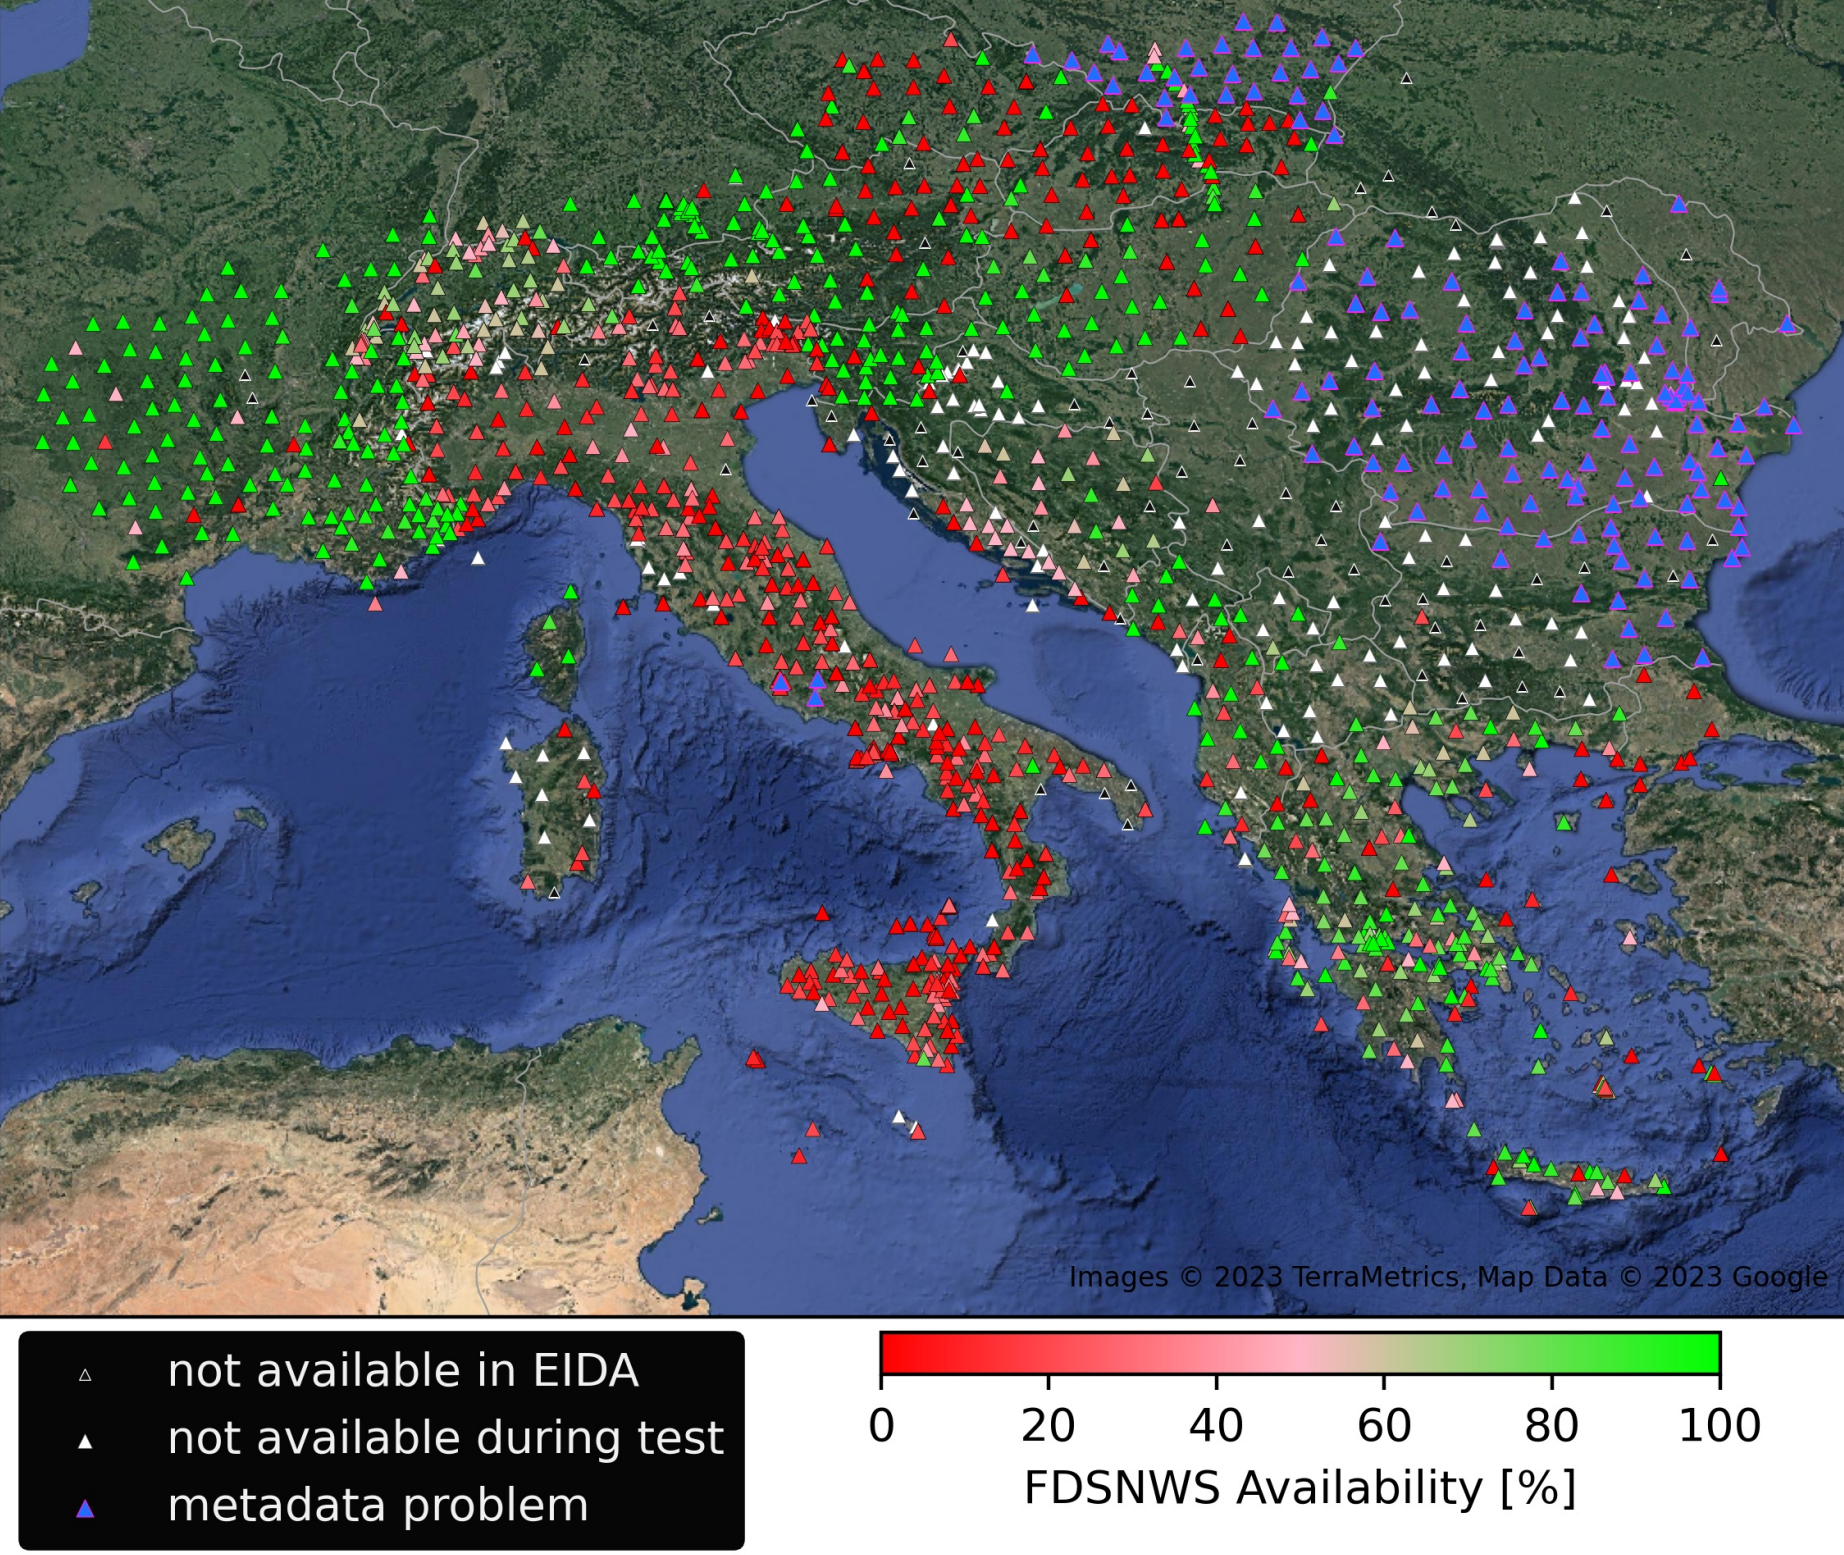

Availability for November 2023, checked on December 15th, 2023

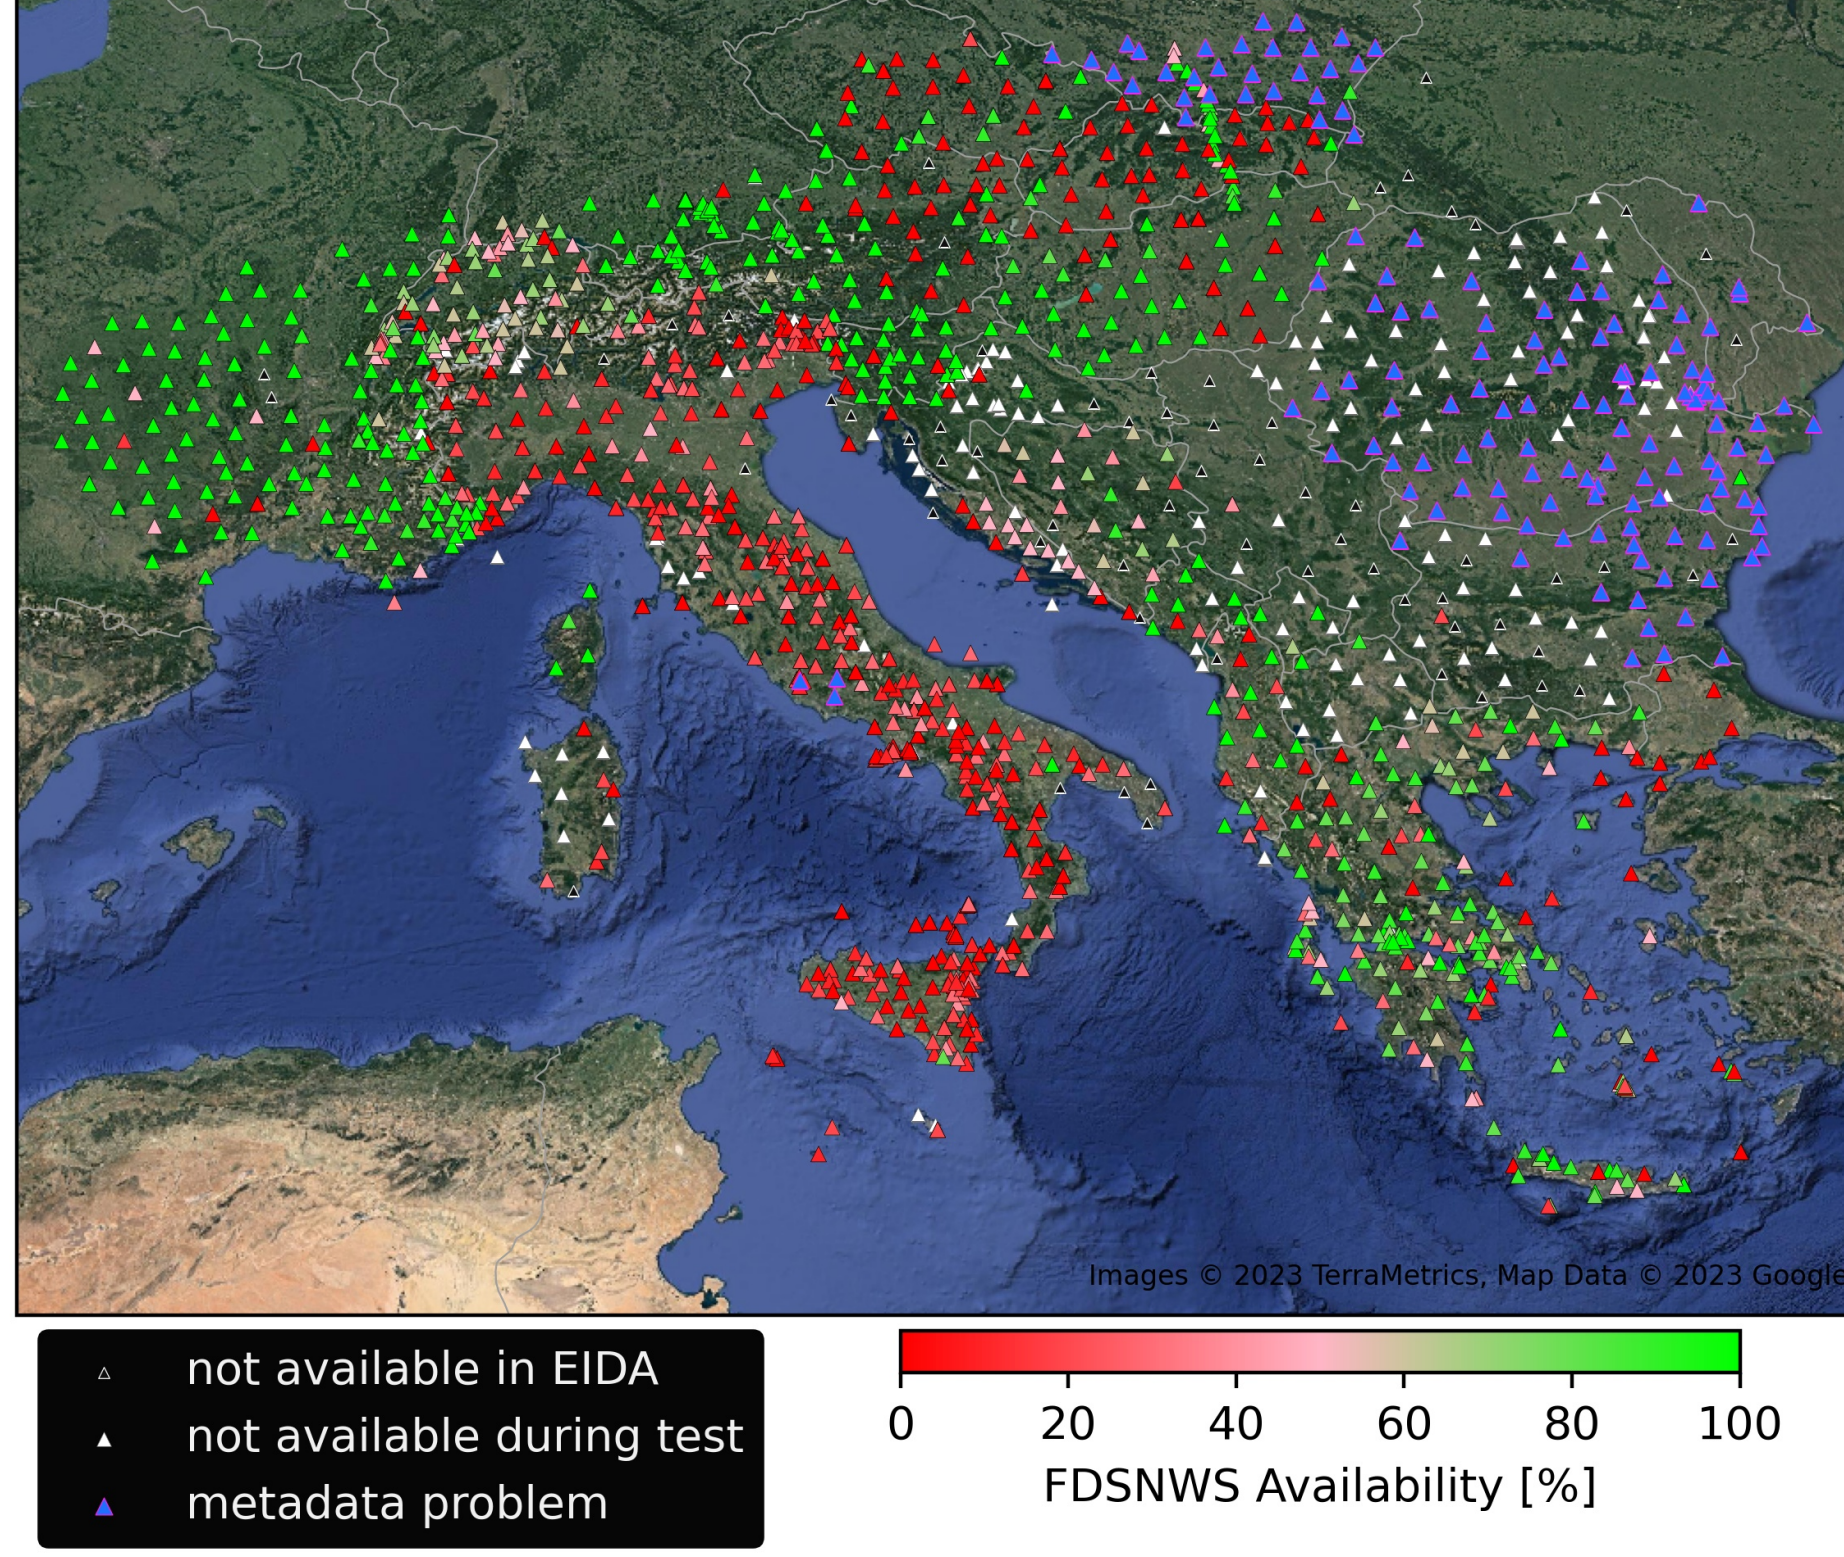

Availability for January 2023, checked on March 24, 2023

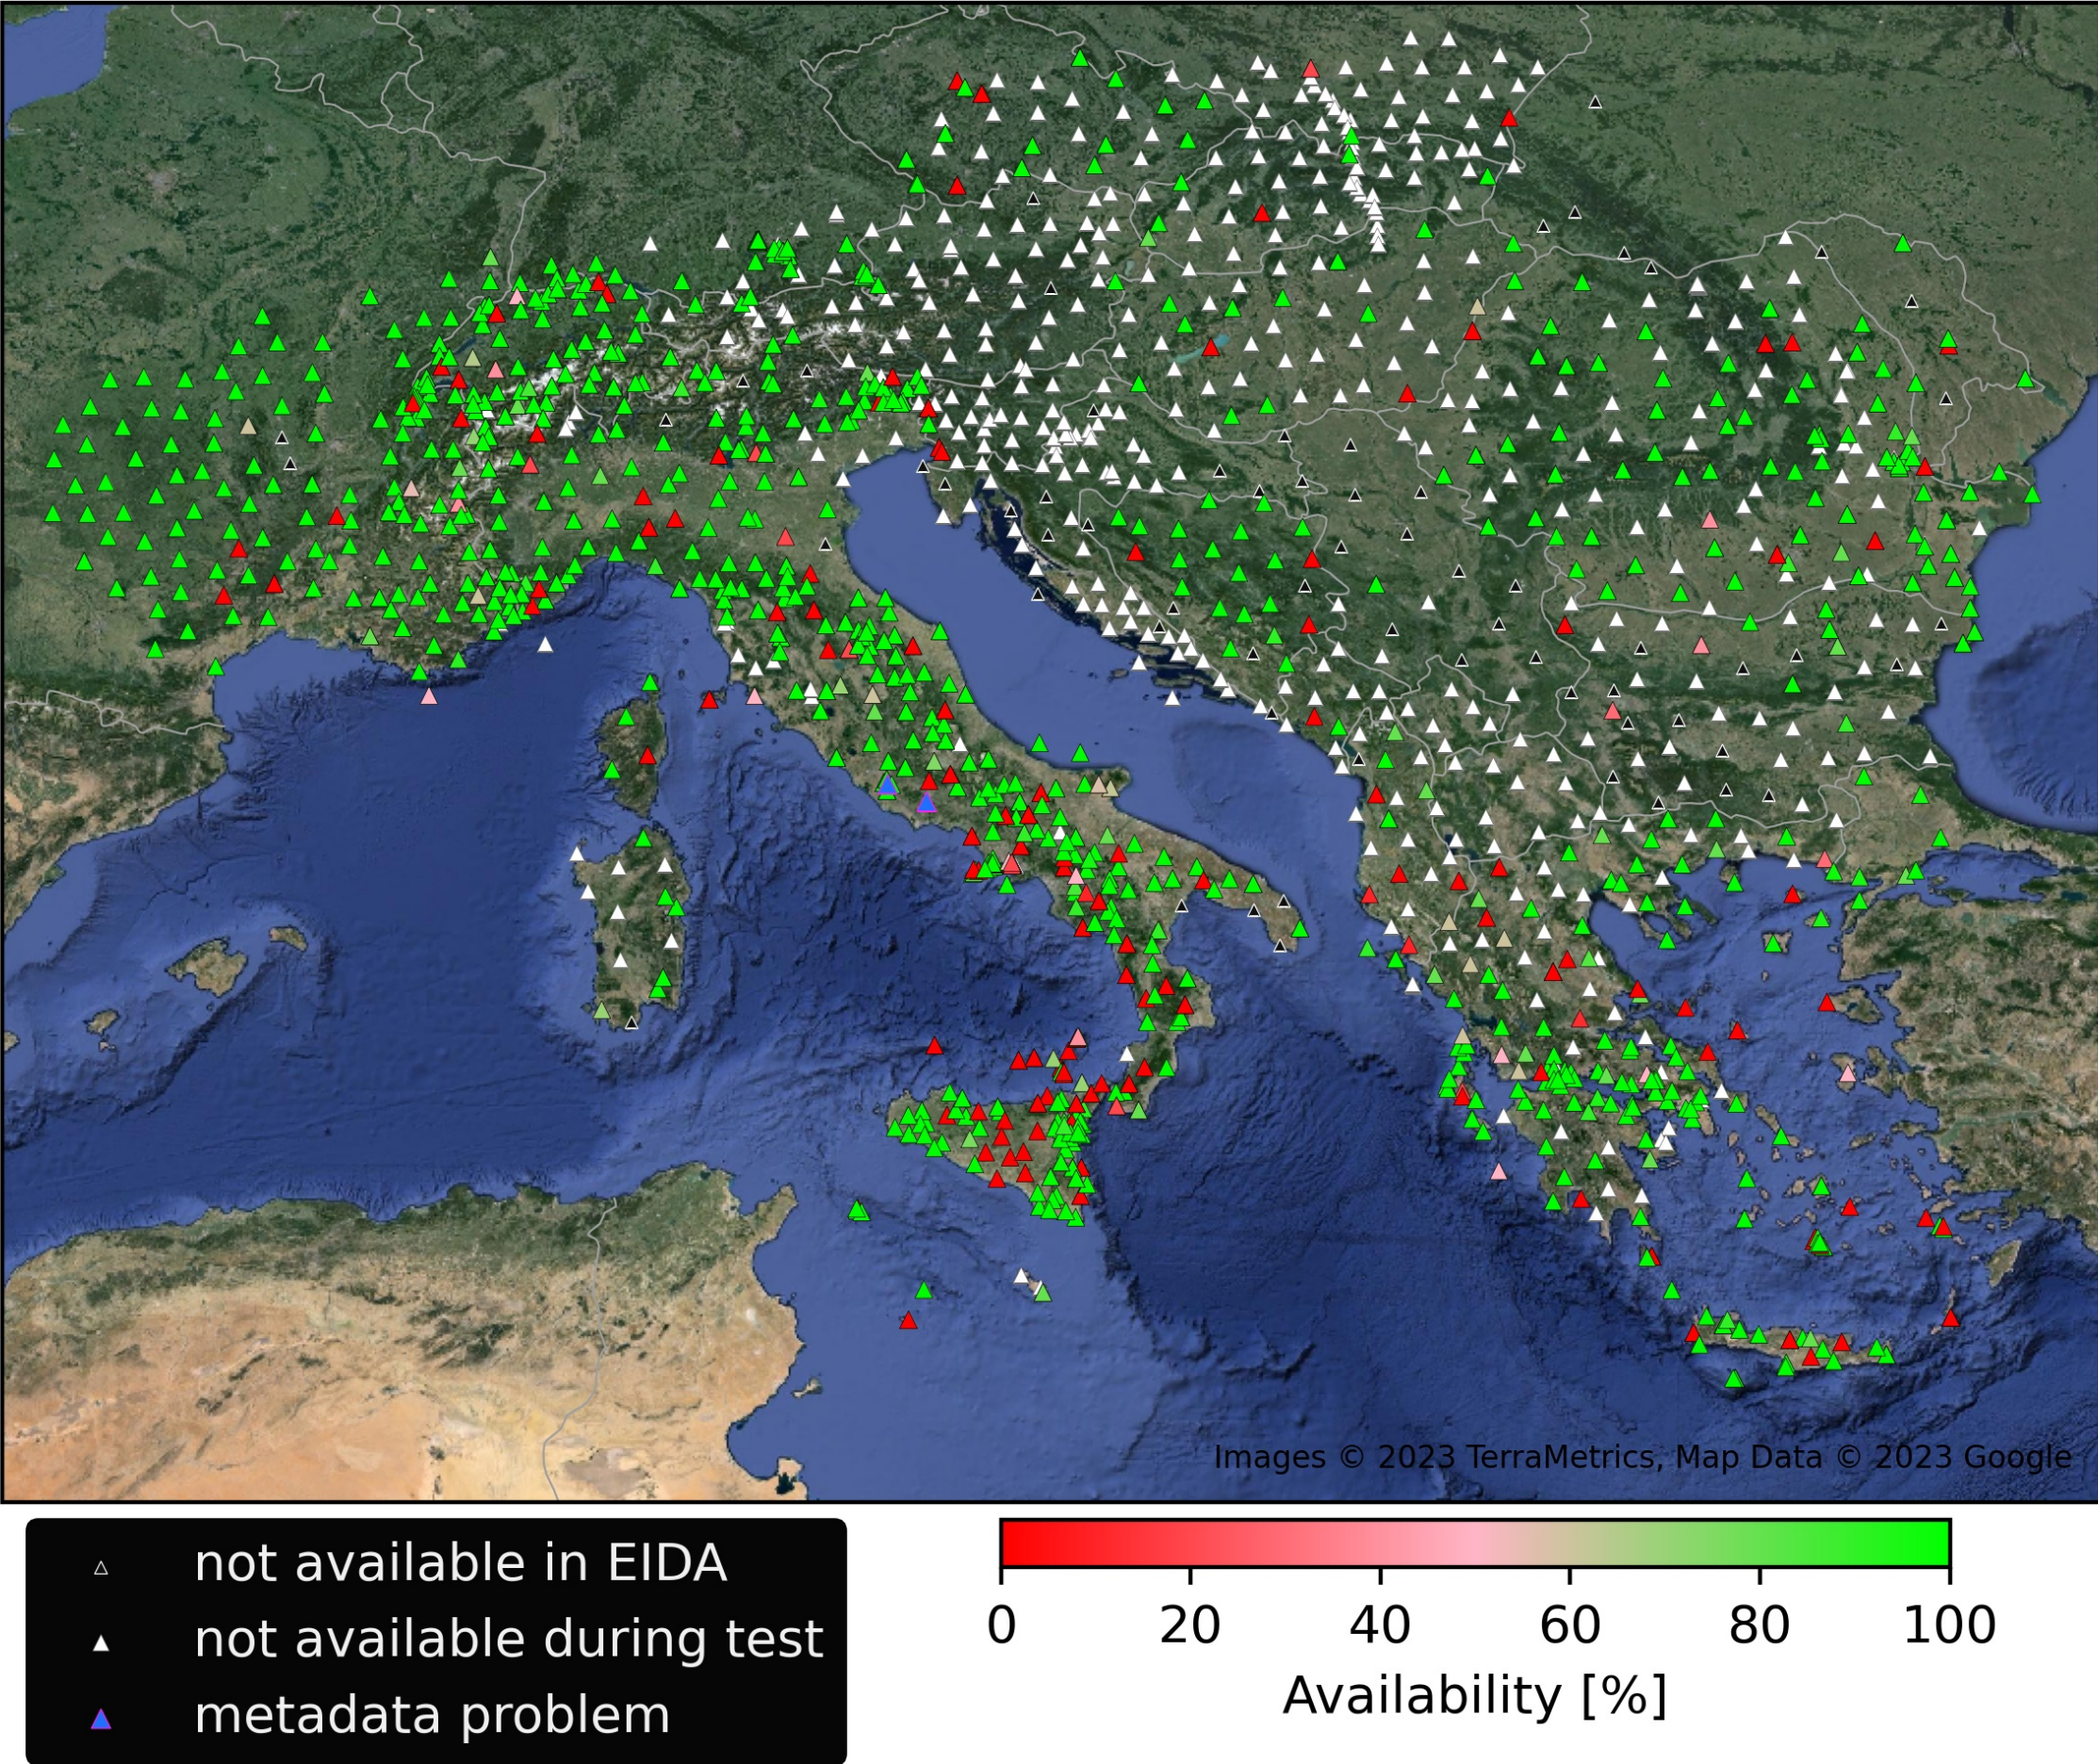

Availability for November 2023, checked on December 15th, 2023

Availability for November 2023, checked on December 15th, 2023

Availability for January 2024, checked on March 1st, 2024

Availability for January 2023, checked on March 29, 2023
